

## MACRO PERFORATED FILM

Mechanical log drilling system for film transpiration, when more ventilation of the content is required.

The processing consists of a mechanical punching system of the film. The drilling can take place in the register and be positioned in specific areas of the film depending on the need. The diameter of the holes is variable from 3mm to 6mm, depending on the content of the pack and its life cycle. Even the geometric shape of the holes can be customized as desired.
